PROBLEM STATEMENT

Marketing budgets are finite and not every channel returns the same value for the money spent. Over the course of February 2021, an organization ran eleven (11) distinct marketing campaigns across four channels. They were social, search, influencer and media (banner) advertising which had a combined daily spend tracked at the campaign level, alongside impressions, clicks, leads and completed orders.

Without a structured view of performance, budget tends to get allocated by habit or by which channel is loudest, rather than by which channel actually returns the most revenue per rupee spent. Some campaigns in this portfolio were quietly losing money while others were multiplying the budget several times over but that pattern was invisible in the raw daily data alone.

This project sets out to answer a single practical question that sits behind every marketing budget conversation:

“Which parts of this spend are working, which parts are not, and what should change next month?”

OBJECTIVES

The analysis was structured around six (6) different specific questions each tied to a decision a marketing or finance stakeholder would actually need to make. These questions are:

1. Determine the overall Return on Market Investment (ROMI) for the full campaign.
2. Break down ROMI by individual campaign to identify top and bottom performers.
3. Examine performance by date by identifying peak spend days, peak revenue days and how conversion rates and Average Order Value (AOV) moved over month.
4. Establish when buyers are most active, comparing weekday and weekend behavior.
5. Compare campaign categories (social, banner, influencer and search) to determine which channels is most efficient.
6. Evaluate geo-targeting effectiveness, comparing Tier 1 and Tier 2 city targeting.

Beyond answering these questions, the broader objective was to build a KPI framework, ROMI, CPC, CPL, CAC, AOV, CTR and two (2) conversion rates stages that could be reused on future campaign data without rebuilding the analysis from scratch.

DATA DICTIONARY

The dataset consists of **308** rows of daily campaign-level marketing data, eleven (**11**) campaigns tracked across all twenty-eight (**28**) of February **2021**. Each row captures a single campaign's activity on a single day.

Column	Data Type	Description
Date	Date	Date of marketing spend
Campaign Name	Text	Campaign identifier/description
Category	Text	Marketing channel type (social, search, influencer, media)
Campaign ID	Number	Unique campaign identifier
Impressions	Number	Number of times the ad was shown
Marketing Budget	Currency	Money spent on the campaign that day
Clicks	Number	Number of ad clicks (website visits)
Leads	Number	Number of sign-ups with credentials left
Orders	Number	Number of completed purchases
Revenue	Currency	Revenue earned that day

The data was clean on arrival. It had no missing values and no duplicate rows across the full **308**-row set. The only notable structure was nuance is that geo-tier targeting (Tier **1** / Tier **2**) only applies to four (**4**) of the eleven (**11**) campaigns, (the Facebook and Instagram tier campaign). The remaining seven (**7**) campaigns are not geo-targeted and were treated as a separate "Not Applicable" group in the location-based analysis.

DATA ANALYSIS PROCESS

1. Data Preparation

The raw data was loaded into a structured Excel Table and enriched with the fields needed to answer the six (**6**) business questions:

- * A Day-of-Week field.
- * A Weekday/Weekend flag.
- * A Campaign Type field (parsed from the campaign name).
- * A Location field identifying which campaigns carry Tier **1** and Tier **2** geo-targeting.

2. KPI Calculation

Every row was extended with full KPI set defined for analysis.

- * $\text{CTR (Click-Through Rate)} = \text{Clicks} \div \text{Impressions}$
- * $\text{Conversion Rate 1 (visitor} \rightarrow \text{lead)} = \text{Leads} \div \text{Clicks}$
- * $\text{Conversion Rate 2 (lead} \rightarrow \text{sale)} = \text{Orders} \div \text{Leads}$
- * $\text{Average Order Value (AOV)} = \text{Revenue} \div \text{Orders}$
- * $\text{Cost Per Click (CPC)} = \text{Marketing Budget} \div \text{Clicks}$
- * $\text{Cost Per Lead (CPL)} = \text{Marketing Budget} \div \text{Leads}$
- * $\text{Customer Acquisition Cost (CAC)} = \text{Marketing Budget} \div \text{Orders}$
- * $\text{Return On Marketing Investment (ROMI)} = (\text{Revenue} - \text{Marketing Budget}) \div \text{Marketing Budget}$
- * $\text{Gross Profit/Loss} = \text{Revenue} - \text{Marketing Budget}$

Some columns formula was wrapped in error-handling logic (IF ERROR) to account for rows with zero orders or zero leads avoiding division errors rather than letting them display as blank or broken cells.

3. Aggregation Methodology

This step mattered more than it might appear. Ratio-based KPIs cannot simply be averaged or summed across rows. Doing this treats every campaign as equally important regardless of how much was actually spent that day, and it also produces numbers that don't correspond to any real business income. Instead, every aggregate KPI in this analysis was recalculated from summed totals. The total revenue and total marketing budget were summed first for a given campaign, category or time-period, and ROMI, CAC, CPL, and AOV were then derived from those totals. This is the difference between asking:

“What is the overall return across all the spend (the appropriate question) and what is the average of 308 daily ratios (a distortion that inflates or misrepresents the real figures)?”

4. Pivot Tables and Dashboard

Twenty (20) pivot tables were built to answer the six (6) business questions from every angle; by campaign, category, geo-tier, date, weekday/weekend; feeding into a single interactive

dashboard with headline KPI figures, trend charts, and category/campaign comparisons supported by slicers and a date timeline for filtering.

BUSINESS INSIGHTS (KEY FINDINGS)

1. Overall Portfolio Return

Across the full month, total marketing budget was ₹30,590,879.82 against the total revenue of ₹42,889,366, producing a gross profit of ₹12,298,486.18 and an overall ROMI of 40.20%. In plain terms, every rupee spent on marketing returned ₹1.40, on average across the whole portfolio.

2. Campaign-level Performance Varies Widely

Campaign	ROMI	CAC (₹)
Youtube_Blogger	+277.3%	2,120
Facebook_Retargeting	+101.5%	2,467
Google_Hot	+83.8%	4,270
Instagram_Tier1	+77.1%	3,384
Instagram_Blogger	+36.8%	3,861
Banner_Partner	+22.4%	3,210
Facebook_Tier1	-6.6%	5,411
Facebook_Tier2	-26.2%	6,822
Google_Wide	-33.7%	4,132
Instagram_Tier2	-37.1%	3,406
Facebook_Lal	-88.6%	8,986

Youtube_Blogger stands well apart from the rest of the portfolio returning nearly triple its budget in revenue at the lowest acquisition of any campaign. At the opposite end, Facebook_Lal (a lookalike audience campaign) lost money on almost every rupee spent, with the highest acquisition cost in the entire dataset.

3. Budget (Spend) and Performance Mostly Move Together

February 20th was both the single largest spend day (₹3,499,171.70) and the single largest revenue day (₹5,261,521) which is a healthy signal, that is, the heaviest investment day was also the most productive one. Conversion behavior, however, was not perfectly stable. The visitor-to-lead conversion rate peaked at 2.83% on February 10th and dipped to a monthly low of 1.29% on February 2nd, while the lead-to-sale conversion rate ranged from a high 15.04% on February 25th down to 8.95% on February 18th making it a notably high spending day, thereby, suggesting that lead quality or sales follow-up capacity did not always scale cleanly with spend. Average Order Value (AOV) across the month settled at ₹5,333, ranging from ₹4,204 to ₹6,283, across individual days.

4. Friday and Saturday Drive Buyer Activity

A simple weekday/weekend split show only a modest difference in buying activity. Breaking activity down by individual day of the week reveals a much sharper pattern: Friday and Saturday are consistently the strongest days for revenue, while Sunday is consistently the weakest. This means Saturday technically a “weekend” day, actually outperformed every weekend except Friday. This nuance would be missed by a weekday-versus-weekend comparison alone.

5. Influencer Marketing Is the Most Efficient Channel

Category	ROMI	CAC (₹)
Influencer	+144.3%	2,756
Media (Banner)	+22.4%	3,210
Search	+7.1%	4,179
Social	-13.7%	5,237

Influencer campaigns deliver by far the strongest return of any channel type. Social is the only category operating at net loss overall which is a significant finding given that it is also the single largest line item in the budget accounting for roughly 45% of total budget.

6. Tier 1 Geo-Targeting Outperforms Tier 2

Among the four (4) campaigns that carries explicit geo-tier targeting, Tier 1 cities delivered a ROMI of +35.3% against a CAC of ₹4,164, while Tier 2 cities returned a ROMI of -28.2% at a higher CAC of ₹5,754. This means that Tier 2 targeting is currently unprofitable on the same campaigns where Tier 1 is profitable. Notably, the seven (7) campaigns without any geo-targeting outperformed both tiers as a group, largely driven by the strength of Youtube_Blogger and Facebook_Retargeting.

RECOMMENDATIONS

1. Reallocate budget away from Facebook_Lal and Tier 2 social targeting, and towards Youtube_Blogger and Facebook Retargeting, which post the highest ROMI and lowest acquisition cost in the portfolio.
2. Conduct a deeper audit of the Social Category. It is the largest spend line in the budget but the only category running at a net loss. Before cutting spend further, review targeting parameters and creative performance to identify whether the issue is fixable or structural.
3. Favor Tier 1 over Tier 2 geo-targeting on any campaign that supports it, since Tier 2 is currently destroying value on both Facebook and Instagram campaign where it is used.
4. Shift incremental spend towards Friday and Saturday, where revenue consistently peaks and reduce budgets on Sunday which is the weakest day of the week.
5. Investigate February 18th conversion dip. Spend scaled up that day but lead-to-sale conversion fell to its monthly low. This is a signal worth checking against the sales team capacity or lead-follow-up processes on high-volume days.
6. Consider scaling Facebook_Retargeting further. It currently runs on one of the smallest budgets in the portfolio despite posting a 101.5% ROMI, suggesting that there is room to grow this campaign profitably.

CONCLUSION

The marketing portfolio as a whole is profitable, returning a 40.20% ROMI across February 2021, but the headline figure conceals a wide spread in performance underneath. Influencer marketing and retargeting campaigns are strongly profitable and comparatively cheap to run, while broad social prospecting, particularly Look-alike (Lal)-audience targeting and Tier 2 geo-targeting is losing money and consuming a disproportionate share of the budget.

The clearest path to improving overall return without increasing total spend is reallocation rather than expansion is shifting budgets toward the campaigns and channels already proven to work, tightening or pausing the campaigns that are not, and aligning spend timing more closely with the Friday-Saturday peak in buyer activity. Applied consistently, these changes will be expected to lift the overall ROMI meaningfully within the same overall budget envelope.
